

Cell and android 18 porn

Continue

While the simplicity and convenience of watching porn from a mobile device makes for a tempting offer, it's a practice that you should perhaps reconsider. Why? Recent research has shown that watching porn on a mobile device rings all sorts of security alarms and puts you at a high risk for getting hacked.The Man's Guide To Kinky Sex:Wandera, a mobile security tech firm, examined the insecurity of porn sites and of mobile devices and made some alarming conclusions. They found that "almost a quarter of malware on mobile devices comes from porn websites," and because "smartphone operating systems, especially Android, are not as secure as desktops, there are many vulnerabilities that can be easily exploited by hackers."The tech firm looked at a number of different porn websites and found, at the time of their research, that 40 of the 50 top adult content websites such as Brazzers, Ashley Madison, and AdultFriendFinder had been exposed to data leaks.(Ready for the real thing? The Men's Health guide to pleasuring a woman will teach you all the secrets to sexual satisfaction.)Conclusion: If you're going to watch porn, know that watching it on your smartphone, no matter how convenient it may be, is putting you and your information at a much higher risk of being hacked compared to using a desktop. Need some more tips to arm yourself against the threat of data exposure? Here's how you can protect your passwords and information from evil hackers. Where there is no app for that on the iPhone, there now is for porn on the competing Android mobile operating system. A Seattle-based company named MiKandi (pronounced "my candy") has released an app store specifically geared towards porn. The application attempts to create a red light district for adult Android apps allowing adult content providers to set up shop within a MiKandi app (see SFW video). Boasting only one previous app (an app called Dildroid), MiKandi's emergence brings with it game-changing potential for smut peddlers on smartphones. In June 2009 the iPhone app called Hottest Girls snuck by Apple's notoriously fickle approval process and saw the light of day ... for a very brief period of time before Apple banned it. "[MiKandi LLC] wanted to find a niche that was not currently being served and adult applications were at the top of the list," Jennifer McEwen, one of the company's founders, told Good Gear Guide. "There are no other adult app stores out there to meet this need of users and developers. So we entered the market with MiKandi to provide value to the mobile application ecosystem." According to reports, the MiKandi top brass consist of former employees of Microsoft, T-Mobile, Converse, and adult industry veterans. These executives promise little to no censorship when it comes to "controversial" apps, except in cases when the law is being broken. "Unfortunately, there will always be someone who doesn't believe the law applies to them," McEwan told Good Gear Guide. "If illegal content is uploaded we will take it down immediately and if necessary take legal action against the developer in question." The developer kit is currently invite-only, but MiKandi plans on an e-mail marketing campaign to get the word out. MiKandi representatives say it has plans to port its app to BlackBerry and Windows Mobile devices as well as Java-compatible mobile phones in early 2010. Vizio got a jump start on its competition today by announcing its plans for mobile devices before the Consumer Electronics Show officially starts in Las Vegas this week. The company-known for its ability to deliver quality HDTVs at reasonable prices-introduced an Android phone, and an Android tablet. Both will be shown at CES in the coming week. While Vizio did not say which version of Android it plans for these devices, given the targeted late second quarter/Summer 2011 release date, it's likely that one or both devices will have Honeycomb, the much-talked about next-gen Android OS that will, among other things, bring tablet support into focus. Both devices will have full Google Android Market support, though. Vizio's strategy is an interesting one, and it makes total sense for a company that's already invested in an app platform. At CES 2010, Vizio announced it was extending its Vizio Internet Apps (VIA) platform to nine HDTVs and to its Blu-ray player, and it had plans to grow the platform beyond the early apps (which include the ubiquitous Netflix streaming). The VIA platform was originally based on Flash and Yahoo Widgets; the latter was the first major initiative to bring apps to HDTVs, but it has fizzled over time. Fast forward to CES 2011: This week, Vizio will show its updated VIA platform, which will now be based on Google TV, and will extend support to other devices, too, including the forthcoming VIA Tablet and VIA Phone. Both devices will feature Android, with the VIA Plus user interface overlay on top of the Android operating system. Clearly, Vizio's strategy isn't to target Android purists; instead, the company aims to develop a unified and common user interface across devices.The company says the VIA Plus interface was created with the intention of it being scaled from handheld devices to 55-inch HDTVs. The bigger endgame? Not only will you get a common interface, but you can expect to use either mobile device as a universal remote control; Vizio says it will support up to 90 percent of consumer electronics devices through the built-in IR blaster on the phone and the tablet. At launch, Vizio was not specific about what the new platform means for apps written in Flash or for the Yahoo Widgets universe. Nor was the company uber-specific on the specs. But what follows is what we already know. The VIA Phone packs a 3G antenna, 1GHz processor, and a 4-inch capacitative touchscreen with 480 by 854-pixel resolution. It will have an accelerometer, GPS, microSD card slot, a front-facing camera for video chat, a 5-megapixel rear camera with flash for photos and HD video capture, and mini-HDMI jack for outputting 720p HD video. The phone's dimensions will measure 2.4-by-4.8-by-0.5 inches, and it will weigh 0.26 pounds. The VIA Tablet also packs a 1GHz processor (like the phone, the CPU's source remains a mystery for now). The Tablet has an 8-inch, 1024 by 768 capacitative touchscreen, which puts it at the same resolution as the current Apple iPad. You'll also get 802.11n Wi-Fi, an accelerometer, GPS, 2GB of internal storage,front-facing camera for video chat, and a microSD card slot for additional storage. It also has a Micro-USB port, and, uniquely (for now), it has three speakers for delivering stereo audio no matter what orientation you hold the tablet in. That's actually an important point-many tablets have their speaker(s) in one spot, and the sound is either blocked or directionally off depending upon how you hold the tablet. The Tablet will measure 6.5-by-8.2-by-0.5 inches (the same thickness as iPad and Samsung's Galaxy Tab), and it will weigh 1.2 pounds (less than iPad, more than Galaxy Tab). Given these products' release date is still a ways out, it's not surprising that Vizio didn't announce pricing or carrier plans (or whether the tablet will be sold sans carrier). But given the company's history of delivering products at a value price, I'd expect Vizio to be one to watch. On iOS: Tap the i icon next to the phone number and select Block this Caller. On Android: Open the Phone app, select the number to block, and tap Block number or Reject call. This article explains how to block phone numbers on iOS and Android phones, as well as how to view and manage numbers and how to hide your number when making outgoing calls. Most smartphones block incoming phone numbers to avoid receiving spam calls or other calls you don't want. Another option available is to block your own Caller ID from displaying on the recipient's device. Both options are possible on Android and iOS phones. Sometimes the operating systems hide these features deep in the settings. Further, different carriers offer various options for blocking numbers, so this feature is not always dependent entirely on the OS. All major mobile phone operating systems offer a way to block incoming phone numbers. You can block numbers from within the phone's Recents section, within FaceTime or inside Messages. Blocking a number from one area blocks all three. From each area: Tap the i icon next to the phone number (or conversation). Select Block this Caller at the bottom of the Info screen. To view and manage blocked numbers: Open Settings. Tap Phone. Tap Call Blocking & Identification. Then, either select a phone number to view its details and select to either add or unblock the number or contact or add a contact to block by scrolling to the bottom of all blocked numbers and choosing Block Contact. This step launches your Contacts app so you can select whom to block. You can also filter your iMessages from people who are not in your contacts list. After you have filtered at least one message, a new tab displays for Unknown Senders. You still get the messages, but they won't be automatically displayed, and you won't receive any notifications. To filter iMessages: Open Settings. Tap Messages. Scroll to and tap Unknown & Spam. Turn on Filter Unknown Senders. Because so many manufacturers produce phones (Samsung, Google, Huawei, Xiaomi, LG, etc.) that run the Android operating system, the procedure for blocking a number can vary widely. Further, versions of Android Marshmallow and older do not natively offer this feature. If you are running an older version like this, your carrier may support it, or you may be able to block a number using an app. To see whether or not your carrier supports phone blocking: Open your Phone app. Select the number you want to block. On a Samsung phone, tap Details. If your carrier supports blocking, you'll have a menu item called something like "Block number" or "Reject call" or perhaps "Add to blacklist." If you're using a different Android phone, like a Pixel, you might do the following after you find the number you want to block in your Phone app: Tap the vertical dot menu in the upper right corner of the screen. Tap Blocked Numbers. Confirm with a tap on Block. If you don't have an option to block a call, you might be able to at least send a call to voicemail: Open your Phone app. Tap Contacts. Tap a name. Tap the pencil icon to edit the contact. Select the menu. Select All calls to voicemail. Depending on your carrier and Android version, you might have to install a separate app to handle call-blocking features. Open the Google Play Store and search for "call blocker." Some well-regarded apps are Call Blocker Free, Mr. Number, and Safest Call Blocker. Some are free and display ads, while some offer a premium version without ads. In addition to controlling incoming calls through call blocking, you can also control whether an outgoing call will display your Caller ID. This capability can be configured to operate as a permanent block or a temporary block on a call-by-call basis. Your phone number can't be blocked when you call toll-free (e.g., 1-800 numbers) and emergency services (911) numbers. Just add the *67 prefix before the phone number on your cell phone. This code is the universal command to deactivate Caller ID. For example, placing a blocked call would look like *67 555 555 5553. On the receiving end, Caller ID will usually display

"private number" or "unknown." Though you won't hear or see a caller ID block confirmation, it will work. Call your cell phone carrier and ask for a line block to permanently suppress your phone number in outbound Caller ID. This change is permanent and irreversible. While customer service may attempt to convince you to reconsider, the choice is yours. Various carriers support additional blocking features, such as blocking specific numbers or messages. Though the code to call your mobile carrier can vary, 611 typically works for cell phone customer service in the United States and Canada. If you temporarily want your number to appear when you have a permanent line block in place, dial *82 before the number. For example, allowing your number to appear in this case would look like *82 555 555 5555. Some people automatically decline calls from phones that block Caller ID. In that case, you'd have to allow Caller ID to make the call. Most Android phones provide a Caller ID blocking feature in the Phone settings, either through the Phone app or Settings | App Info | Phone. Some Android versions older than Marshmallow include this feature under an Additional Settings option within your Phone settings. In iOS, the call blocking feature is under the Phone settings; Open Settings | Phone. Press Show My Caller ID. Use the toggle switch to show or hide your number. FAQ How do I block numbers on my house phone? If you want to block numbers on a landline, you may be able to enter specific phone numbers on your service provider's website. If you have caller ID set up for your landline, you can usually block private numbers by dialing *77. How do I block text messages on Android and iPhone? To block text messages on Android, open a conversation and tap the three dots > Details > Block & report spam. On iPhone, go to Settings > Messages > Blocked Contacts > Add New. How do I block numbers on a flip phone? It depends on your phone's model, but try going to your calls, find the number you wish to block, then select Options > Block number.
